WO 2004/091173 A1

(57) Abstract: The invention relates to a method and an arrangement for the configuration of a device (EG) in a data network (LAN). According to said method, a domain name is first stored in the device (EG). The device (EG) then transfers an inquiry message comprising the domain name to an addressing server (DNS) that serves for the conversion between the domain name and the associated internet addresses. In a further step, the addressing server (DNS) transmits an address information of a parameter server (ADS) associated with said device (EG) to the device (EG) as a response to said inquiry message. The device (EG) establishes a link to the parameter server (ADS) on the basis of said address information. The parameter server (ADS) transmits via this link parameters to the device (EG) which serve to configure the device (EG).

Danach überträgt die Einrichtung (EG) eine Abfragenachricht, die den Domänen-Namen umfasst, zu einem Adressierungs-Server (DNS), der der Umsetzung zwischen Domänen-Namen und den diesen zugehörigen Internet-Adressen

dient. In einem weiteren Schritt überträgt der Adressierungs-Server (DNS) an die Einrichtung (EG) als Antwort auf die Abfragenachricht eine Adressinformation eines dieser Einrichtung (EG) zugeordneten Parameter-Servers (ADS), wonach die Einrichtung (EG) anhand der Adressinformation eine Verbindung zu dem Parameter-Server (ADS) herstellt. Der Parameter-Server (ADS) überträgt über diese Verbindung zu der Einrichtung (EG) Parameter, die der Konfiguration der Einrichtung (EG) dienen.
